

RISO MASTER HARDENER RED

Features

Helps RISO DIGITAL SCREEN MASTER to improve its durability

RISO MASTER HARDENER RED reinforces the film coating on the screen master and prevents it from causing pinholes. The longevity of the screen master is dramatically improved. As a result, more printing is possible from one screen master.

Improves visibility of image

The hardner contains red pigments and colors the surface of the screen master to red. Consequently, the imaged area becomes clearly visible which enables easy and precise registration adjustment for multi-color printings.

Applicable to both water-based ink & plastisol ink

No worries for dissolution of color pigment with the new hardener when using water-based ink.*

*According to our research
